

DANIEL GRAHAM

# CLOUD FIRESTORE

## PART I

# WHAT IS FIRESTORE/FIREBASE

NO SQL DATABASE DESIGN TO RUN IN CLOUD

# WHAT IS A DATABASE

- "a structured set of data held in a computer, especially one that is accessible in various ways."

## USER

| KEY | USERNAME | LOGIN_DATE |
|-----|----------|------------|
| 1   | "BOT99"  | 2/11/2019  |
| 2   | "HUMAN2" | 10/2/2019  |

- Data is stored in tables columns and rows

USER

COLUMN

| KEY | USERNAME | LOGIN_DATE |
|-----|----------|------------|
| 1   | "BOT99"  | 2/11/2019  |
| 2   | "HUMAN2" | 10/2/2019  |

ROW

DATA

- The structure of each table is **fixed** when it is created
- Each new row of data must contain **same number** of columns
- The data type of the columns must match

USER **SCHEMA**

| KEY | USERNAME | LOGIN_DATE |
|-----|----------|------------|
| 1   | "BOT99"  | 2/11/2019  |
| 2   | "HUMAN2" | 10/2/2019  |
| 3   | 2        | 2/2/2019   |

ALL VALUES IN THE COLUMN  
MUST BE SAME TYPE

# BECAUSE THE THESE RESTRICTIONS

- Because the schema restriction normally table as design so store objects of the type for example

| KEY | USERNAME | LOGIN_DATE |
|-----|----------|------------|
| 1   | "BOT99"  | 2/11/2019  |
| 2   | "HUMAN2" | 10/2/2019  |

| KEY | REVIEW | COMMENT |
|-----|--------|---------|
| 1   | 4      | "YUMMY" |
| 2   | 1      | "YUCKY" |

# BECAUSE THE THESE RESTRICTIONS

- Because the schema restriction normally table as design so store objects of the type for example

| KEY | USERNAME | LOGIN_DATE |
|-----|----------|------------|
| 1   | "BOT99"  | 2/11/2019  |
| 2   | "HUMAN2" | 10/2/2019  |

| KEY | REVIEW | COMMENT |
|-----|--------|---------|
| 1   | 4      | "YUMMY" |
| 2   | 1      | "YUCKY" |

# BECAUSE THE THESE RESTRICTIONS

- Because the schema restriction normally table as design so store objects of the type for example

| KEY | USERNAME | LOGIN_DATE |

| 1   | 4      | "YUMMY" | 1   | 1   |
| 2   | 1      | "YUCKY" | 1   | 2   |

| KEY | USERNAME | LOGIN_DATE |
|-----|----------|------------|
| 1   | "BOT99"  | 2/11/2019  |
| 2   | "HUMAN2" | 10/2/2019  |

```
{
  "dinners": [
    {
      "key": 1,
      "name": "ohill",
      "location": "north",
      "reviews": [
        {
          "key": 1,
          "review": 4,
          "comment": "yummy",
          "user": {
            "key": 1,
            "username": "BOT99",
            "login_date": "2/11/2019"
          }
        }
      ]
    }
  ]
}
```

- In NO SQL DATA there are no restriction on what you can place in the database

NO Guarantee at the data level of fields contained in your object. So code defensively and check

# NO SQL DATABASES DON'T USE SQL

```
SELECT * FROM DINERS,  
REVIEWS, USERS  
WHERE DINERS.KEY = 1  
AND  
REVIEWS.RID = DINER.KEY  
AND  
REVIEWS.UID = USERS.KEY
```

DIFFICULT TO DO  
JOINS

Typically going to  
Retrieving a collection

# LOOK AT NO SQL VERSION OF DINER REVIEW APP

WILL HAVE DUPLICATED DATA: USERID SO IF A USER CHANGES  
IDS WILL HAVE MAKE CHANGES ACROSS ALL REVIEW DOCUMENTS

# DUPLICATE DATA IS BAD

- You will have update user objects for all review if user data changes.
- Trade offs. (And potential research problem)
  - Since you doing more reads of reviews that updates of user info. It might be worth it.
- Normalizing. No SQL database open question.
